

Barriers in the Research Data Lifecycle: From Collection to Reuse

Roberto dos Reis

The Scientific Data Lifecycle

- Barriers Compound: Gaps at each stage amplify downstream – e.g., poor planning hinders FAIR sharing
- Legacy Systems: Many workflows still rely on disconnected, manual, vendor-specific tools
- At-Risk Data: Without persistent IDs or metadata, up to 80% of scientific datasets become unusable in 5 years

Fragmentation Across Lifecycle Stages

Metadata Inconsistency & Provenance Gaps

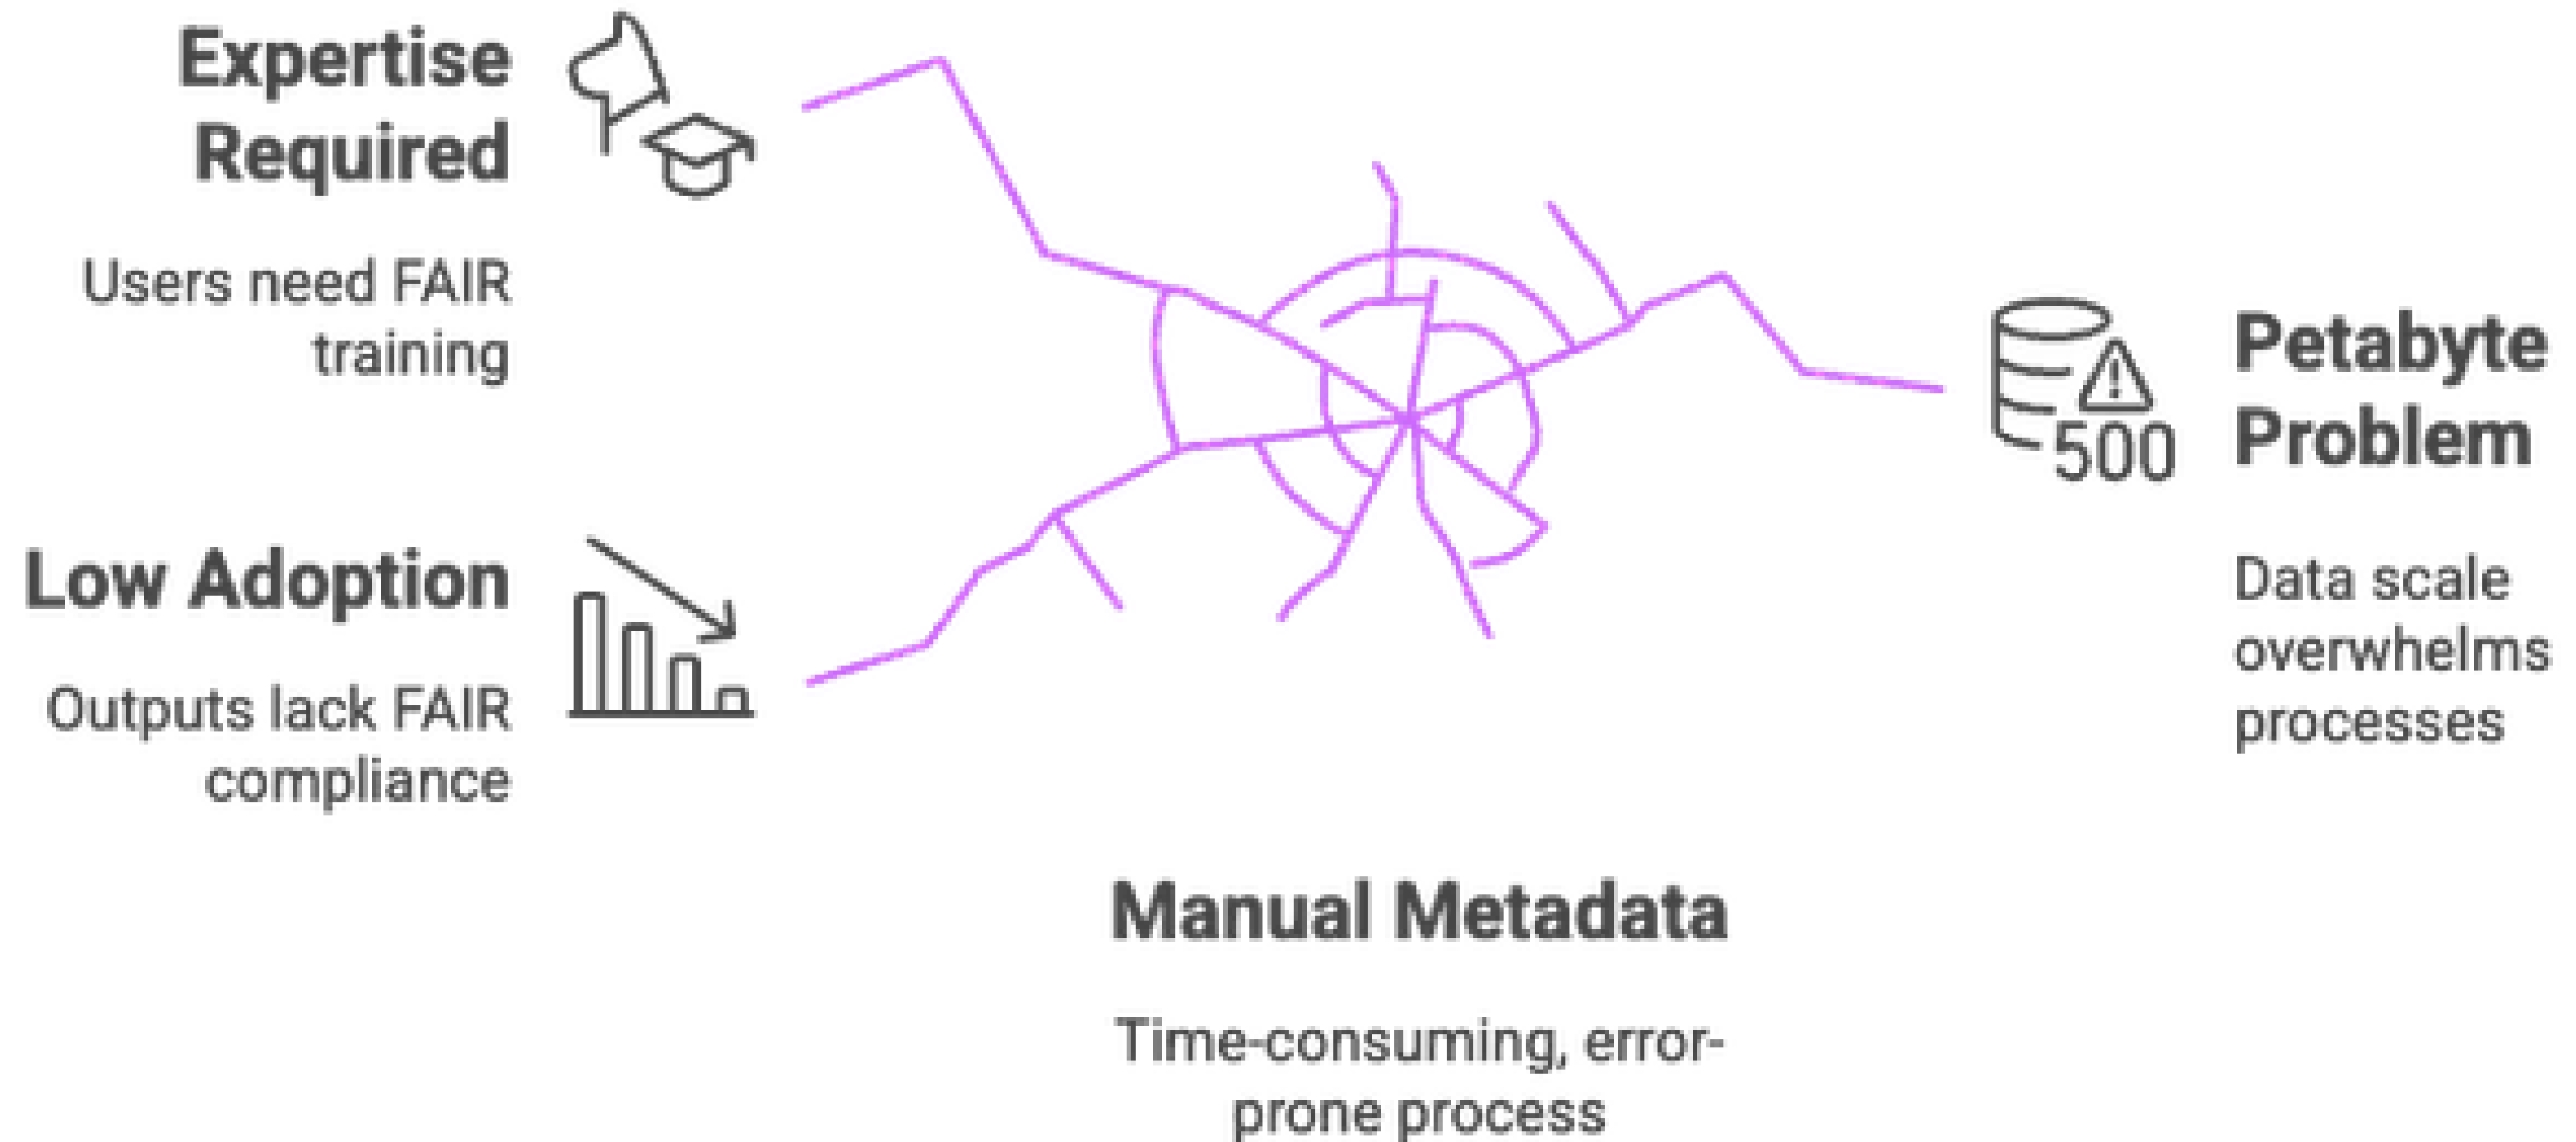

Silos and Institutional Inequity

Access Barriers Limit Research Participation

Manual Curation & FAIR Compliance Burden

Unsustainable Data Stewardship Models

Reuse & Discoverability Deficiencies

Data Exists – But Can't Be Found

Limited Search Capabilities

AI-Optimized Search

No Semantic Discovery

Semantic Data Discovery

No AI Optimization

AI Optimization

Incompatible Instrumentation & Protocols

- **Vendor Lock-In:** Every platform (JEOL, Thermo, Hitachi, etc.) uses different control protocols
- **Non-Portable Workflows:** Protocols and settings are not transferrable
- **Fragmented Training:** Users must retrain for each platform

Implications for NUANCE

What's at Stake

- **Slowed Discovery:** Long time-to-data → long time-to-insight
- **Wasted Infrastructure:** National investment not fully utilized
- **Equity Gaps Widen:** Under-resourced institutions fall further behind
- **Compliance Risks:** Failing to meet FAIR/open mandates can threaten funding

Lost Datasets = Lost Science

Solutions to Lifecycle Barriers

Systemic Innovation Across the Stack

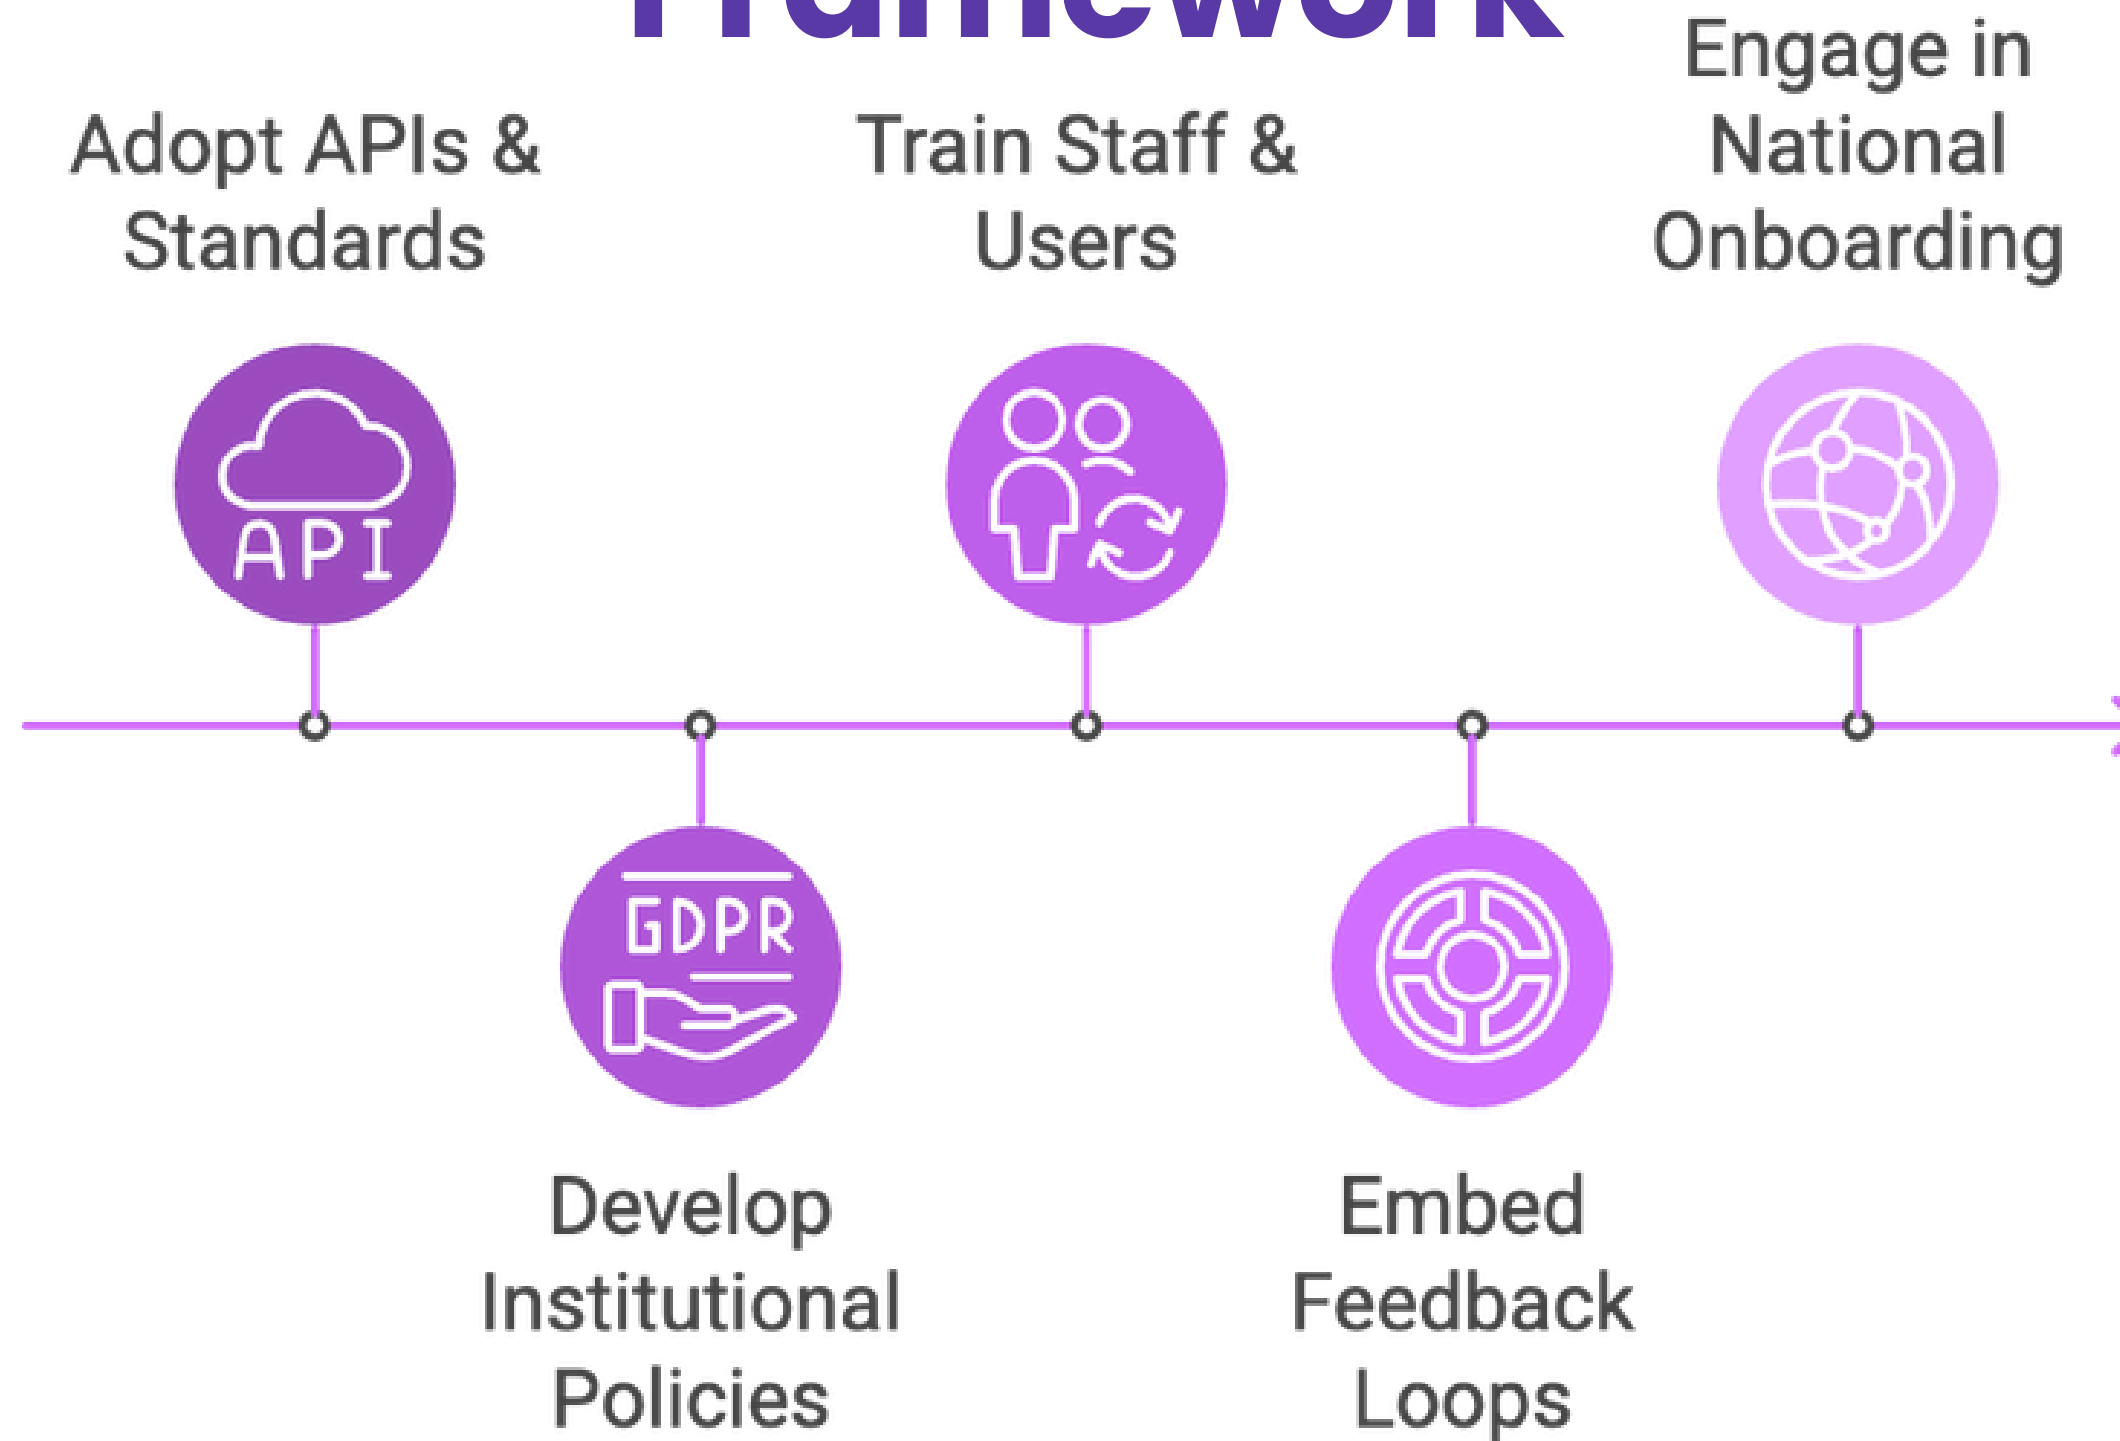

AI-Guided Design: Reduces trial-and-error and planning burden

Universal Instrument Control: Vendor-agnostic, secure, and remote

Federated, Compressed Analysis: Petabyte-scale computation and similarity search

Automated FAIR Compliance: Real-time metadata, DOIs, provenance, auditability

Pathways to a Robust Lifecycle Framework

Next Steps

01

AI-Guided Design

Automated protocol optimization, multi-modal technique coordination, real-time safety validation.

02

Universal Control

Different instrument types supported, automated quality assurance, zero equipment damage (AI safety).

03

Federated Analysis

100-1000x semantic compression, multi-modal data fusion, and continuous AI model improvement.

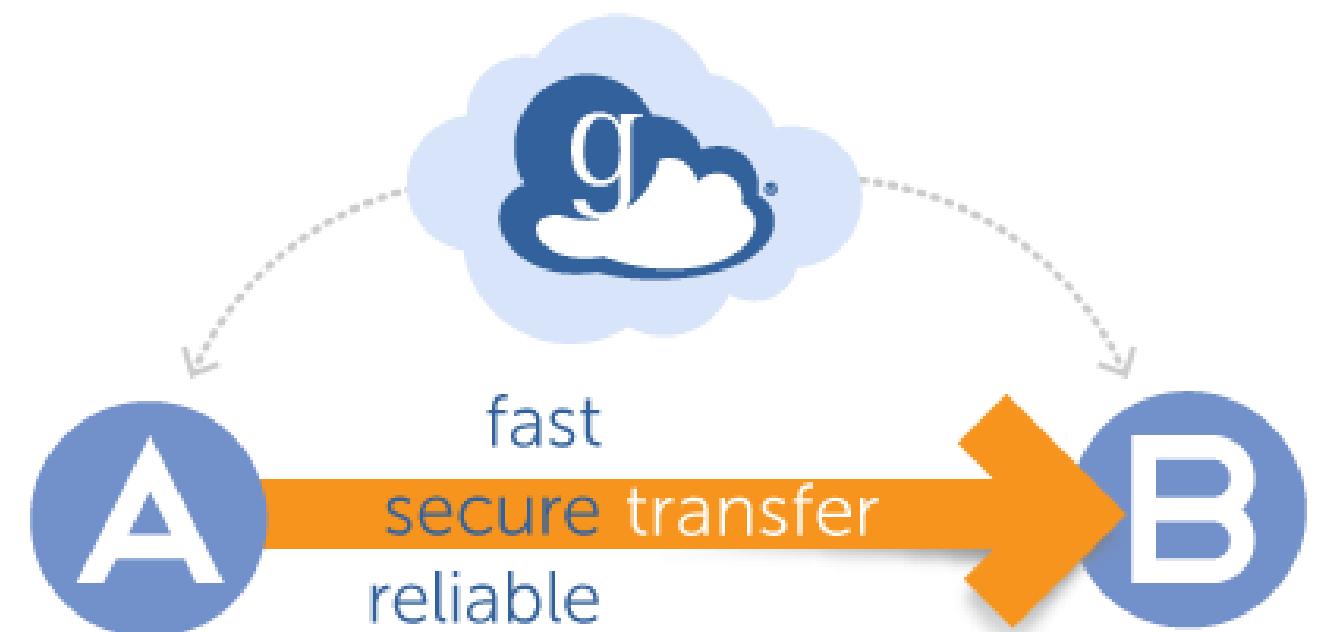

04

Automated FAIR

Standardized vocabularies, cryptographic provenance, and cross-institutional discovery.

Next Steps

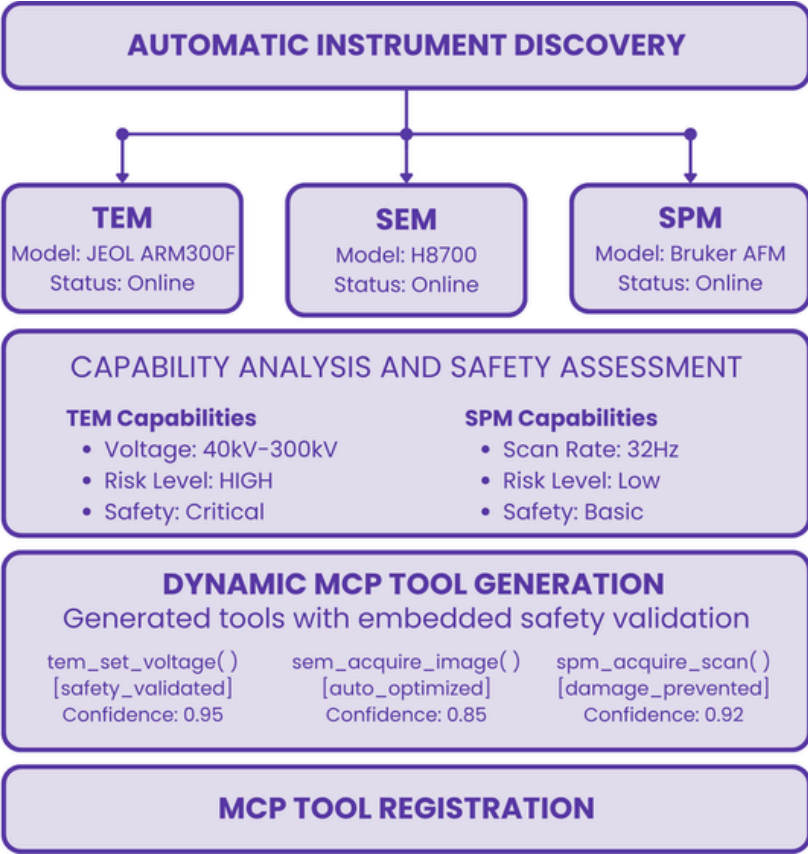

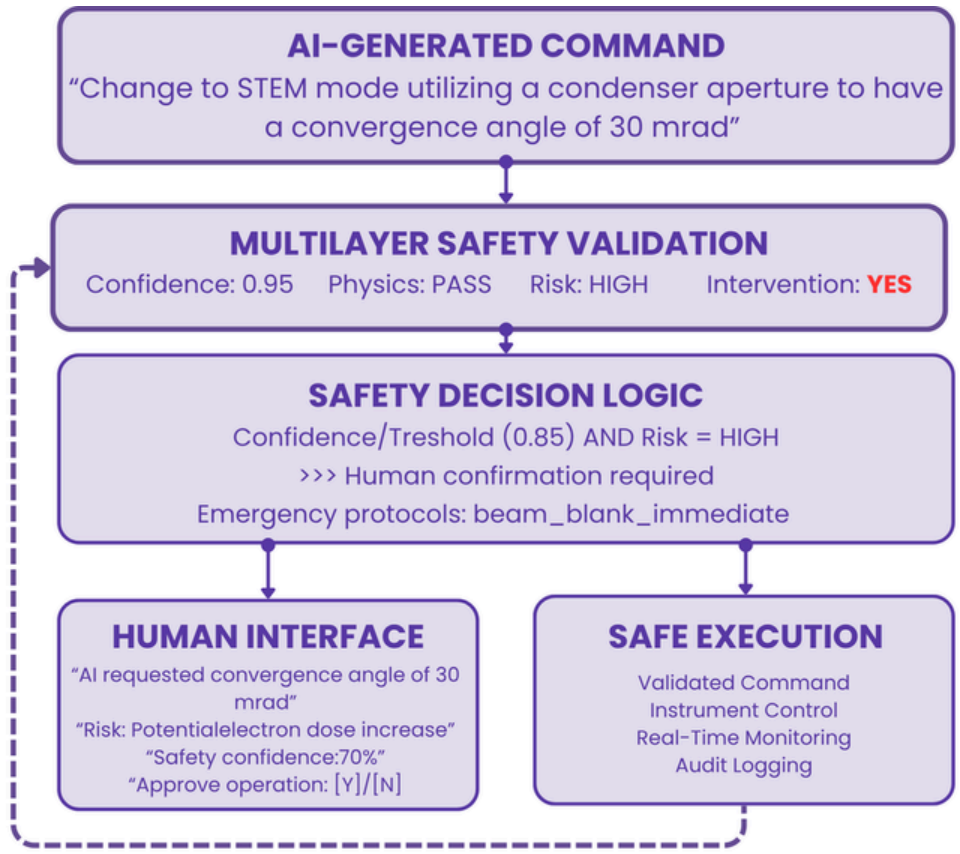

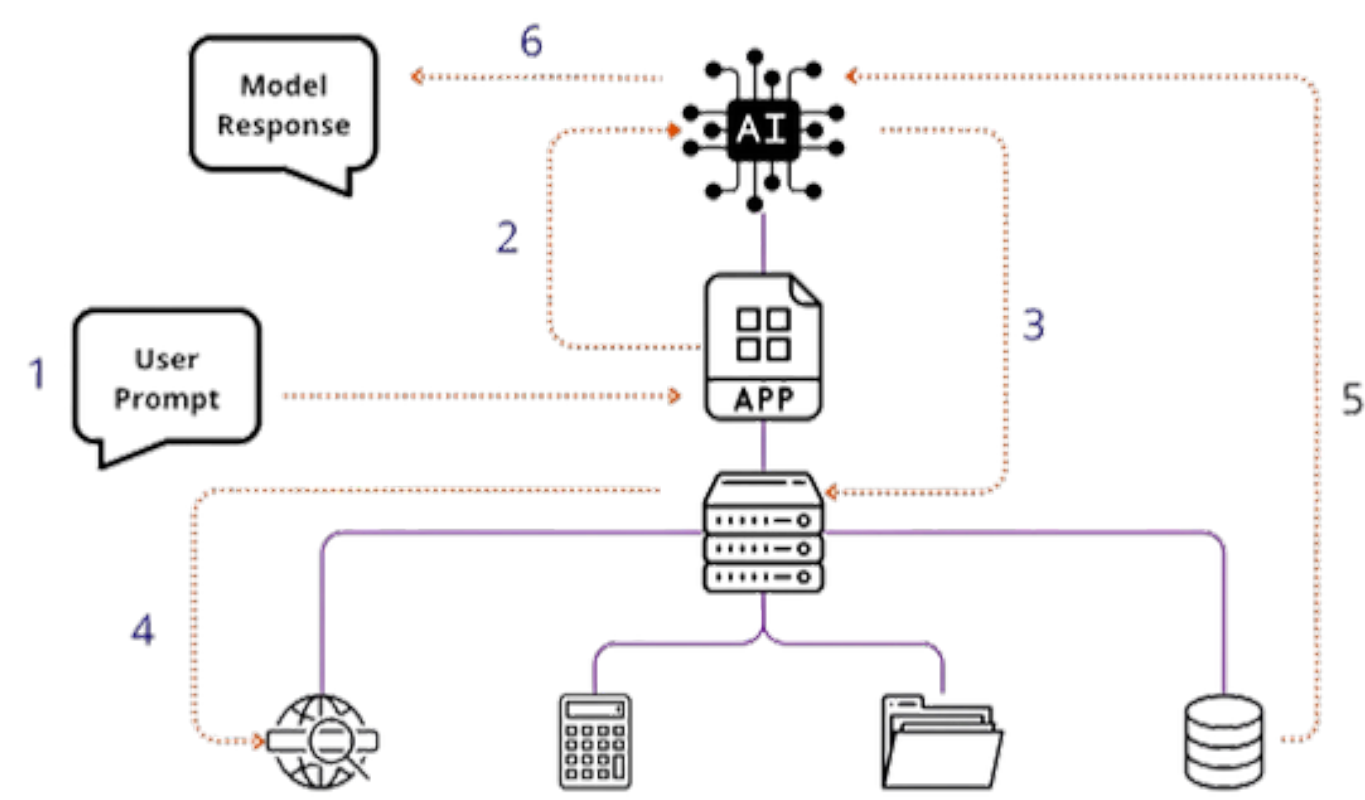

Next Steps

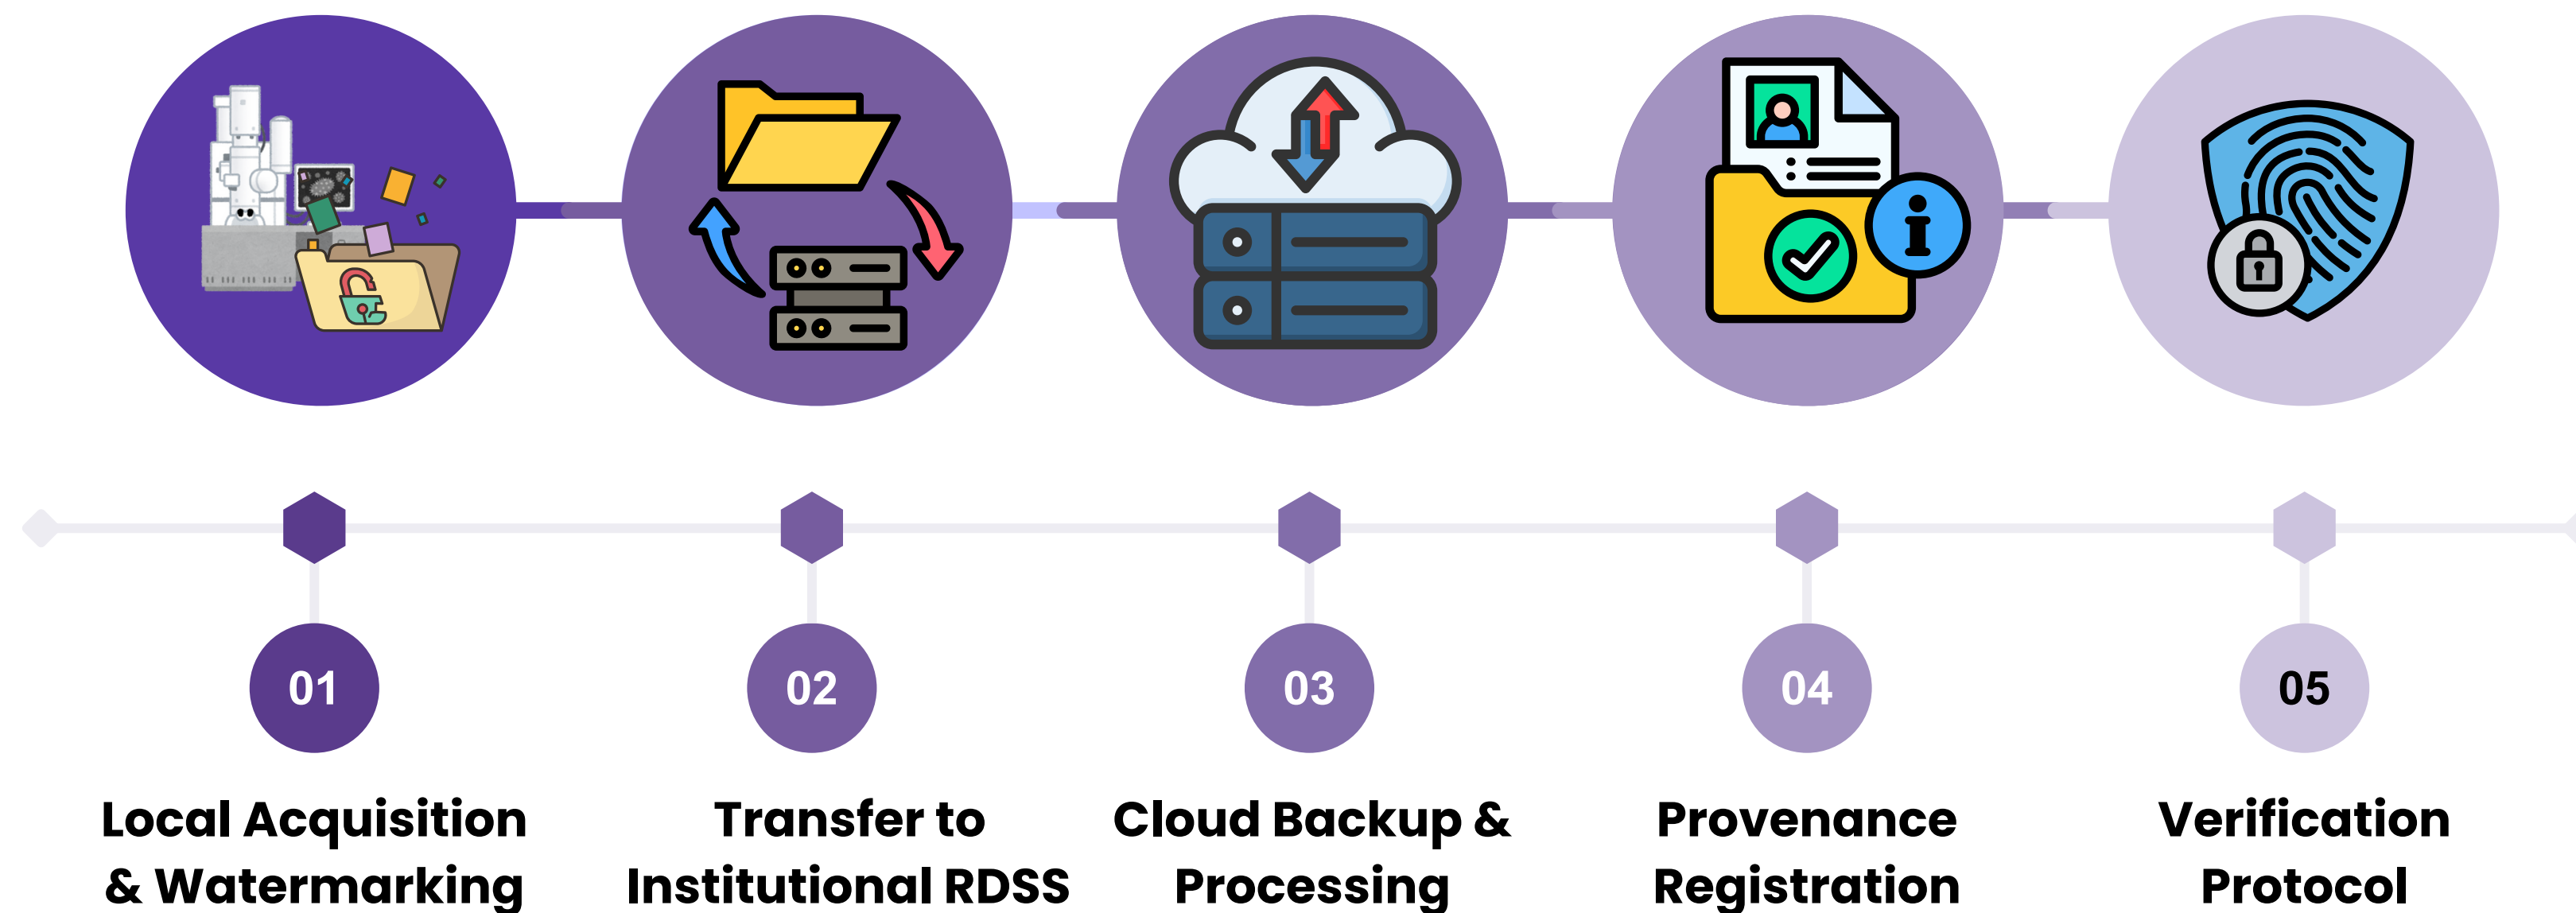

An open protocol for connecting AI models to tools, APIs, and external context.

MCP acts as a bridge between models and the outside world.

Next Steps

Conclusion & Next Steps

Barriers Are Real – But Solvable:

With the right architecture, culture, and automation

NUANCE at the Vanguard:

Already pioneering solutions, now scaling them

Your Role:

Help shape an equitable, AI-ready, interoperable future of data-intensive science
